## On-Site Acoustical Analysis

Performing an on-site acoustical analysis can be very expensive but the advantage along with the certified results outweighs the initial costs. The capabilities of the instrumentation used along with the knowledge and personal attention also play a key role in identifying the source of the noise problem and how to correctly solve each and every issue. How loud the noise problem is by far is not the only concern, the frequencies at which are creating the noise is more important for then the correct product (s) can be recommended.

Testing can take a short time or several hours so please plan accordingly. Detailed decibel and frequency readings and pictures will be taken and after all readings are completed and downloaded within a few days we will send you a detailed report that will have all readings downloaded and plotted on a layout showing you exactly where all reading were taken. Along with this report recommendations on how to solve each noise problem and the correct product and most importantly placement of the materials will be described. All Surfacing Solution's products are guaranteed to perform to or above the listed NRC/STC ratings. Call for detailed prices for a complete analysis. Allow 14-21 days lead time to arrange travel if possible

Please realize that some noise issues can be solved by simply calling us and explaining in details the problem and your concerns.
